Geostatistical Simulation: Models and Algorithms By Christian Lantuejoul

This book deals with the estimation of natural resources using the Monte Carlo methodology. It includes a set of tools to describe the morphological, statistical and stereological properties of spatial random models. Furthermore, the author presents a wide range of spatial models, including random sets and functions, point processes and object populations applicable to the geosciences. The text is based on a series of courses given in the USA and Latin America to civil, mining and petroleum engineers as well as graduate students in statistics. It is the first book to discuss the geostatistical simulation techniques in such a specific way.

Editorial Review

Review

From the reviews of the first edition:

"Geostatistical simulations have mainly been developed during the last decade. ... this is the first book that is entirely dedicated to this subject. ... it has been a good initiative by C. Lantuéjoul to compile this book and it will become a basic reference work, partly because it is the first work dedicated entirely to this new subject of geostatistics. ... The book mainly aims at researchers who are using geostatistical simulations and who would like to know more about the theoretical background" (André Vervoort, *Geologica Belgica*, Vol. 7 (3-4), 2004)

"The author has dedicated the book to Georges Matheron, founder of modern geostatistics. Well organized is the book in three parts, namely (i) the tools, (ii) the algorithm and (iii) the models. ... It certainly fills a gap and is therefore welcome to the geostatistics market." (Erik W. Grafarend, *Zentralblatt MATH*, Vol. 990 (15), 2002)

From the Back Cover

Within the geoscience community the estimation of natural resources is a challenging topic. The difficulties are threefold: Initially, the design of appropriate models to take account of the complexity of the variables of interest and their interactions. This book discusses a wide range of spatial models, including random sets and functions, point processes and object populations. Secondly, the construction of algorithms which reproduce the variability inherent in the models. Finally, the conditioning of the simulations for the data, which can considerably reduce their variability. Besides the classical algorithm for gaussian random functions, specific algorithms based on markovian iterations are presented for conditioning a wide range of spatial models (boolean model, Voronoi tessellation, substitution random function etc.) This volume is the result of a series of courses given in the USA and Latin America to civil, mining and petroleum engineers, as well as to graduate students in statistics. It is the first book to discuss geostatistical simulation techniques in such a systematic way.

Users Review

From reader reviews:

Harry Oliver:

What do you consider book? It is just for students since they are still students or the idea for all people in the world, what the best subject for that? Simply you can be answered for that issue above. Every person has various personality and hobby for each and every other. Don't to be pushed someone or something that they don't want do that. You must know how great in addition to important the book *Geostatistical Simulation: Models and Algorithms*. All type of book is it possible to see on many resources. You can look for the internet methods or other social media.

Christopher Larsen:

Reading can be called brain hangout, why? Because while you are reading a book particularly a book entitled Geostatistical Simulation: Models and Algorithms the mind will drift away through every dimension, wandering in each aspect that maybe unidentified for but surely will end up your mind friends. Imaging each word written in an e-book then become one form conclusion and explanation in which maybe you never get prior to. The Geostatistical Simulation: Models and Algorithms giving you one more experience more than blown away your head but also giving you useful information for your better life in this era. So now let us show you the relaxing pattern at this point is your body and mind are going to be pleased when you are finished studying it, like winning a. Do you want to try this extraordinary spending spare time activity?

James Rodriguez:

This Geostatistical Simulation: Models and Algorithms is a great guide for you because the content that is full of information for you who all always deal with the world and get to make a decision every minute. This book reveals its facts accurately using great arranged words or we can say no rambling sentences in it. So if you are read that hurriedly you can have whole information in it. Doesn't mean it only offers you straight forward sentences but hard core information with attractive delivering sentences. Having Geostatistical Simulation: Models and Algorithms in your hand like obtaining the world in your arm, facts in it is not a ridiculous one. We can say that no reserve that offer you the world within ten or fifteen moments right but this e-book already does that. So, this really is a good reading book. Hi Mr. and Mrs. active do you still doubt this?

Darren Perez:

Reading a publication makes you to get more knowledge from that. You can take knowledge and information from the book. A book is written or printed or created from each source in which is filled with updates of news. With this modern era like currently, many ways to get information are available for an individual. From media social just like newspaper, magazines, science reserve, encyclopedia, reference book, story and comic. You can add your understanding by that book. Ready to spend your spare time to open your book? Or just trying to find the Geostatistical Simulation: Models and Algorithms when you essential it?
